Laboratory Manual for General Biology

Intro to Biology

This self-guided introductory biology lab manual features a full range of activities that show how basic biological concepts can be applied to a wide variety of plants, animals, and microorganisms. It is designed to help readers (including those who are academically underprepared) acquire the basic knowledge needed to make informed decisions about biological questions that arise in everyday life, develop the problem-solving skills that will lead to success in a competitive job market, and learn to work effectively and productively as a member of a team. Focuses on the scientific method -- requiring readers to develop hypotheses, set up experiments, collect data, record their data in graphs and charts, and draw conclusions from their experimental results. Offers opportunities to transfer content knowledge to real life applications through questions interwoven into each activity. Each laboratory includes a brief discussion of background information, hints for solving problems, important safety information, Comprehension Checks and Self Tests (with answers). For anyone beginning a study of biology, including those who are academically underprepared or from an ESL background.

This laboratory manual is designed for an introductory majors biology course with a broad survey of basic laboratory techniques. The experiments and procedures are simple, safe, easy to perform, and especially appropriate for large classes. Few experiments require a second class-meeting to complete the procedure. Each exercise includes many photographs, traditional topics, and experiments that help students learn about life.

Procedures within each exercise are numerous and discrete so that an exercise can be tailored to the needs of the students, the style of the instructor, and the facilities available.

Introduction to Biology Laboratory Manual

Lab Manual

The Fundamentals of Scientific Research: An Introductory Laboratory Manual is a laboratory manual geared towards first semester undergraduates enrolled in general biology courses focusing on cell biology. This laboratory curriculum centers on studying a single organism throughout the entire semester - Serratia marcescens, or S. marcescens, a bacterium unique in its production of the red pigment prodigiosin. The manual separates the laboratory course into two separate modules. The first module familiarizes students with the organism and lab equipment by performing growth curves, Lowry protein assays, quantifying prodigiosin and ATP production, and by performing complementation studies to understand the biochemical pathway responsible for prodigiosin production. Students learn to use Microsoft Excel to prepare and present data in graphical format, and how to calculate their data into meaningful numbers that can be compared across experiments. The second module requires that the students employ UV mutagenesis to generate hyper-pigmented mutants of S. marcescens for further characterization. Students use experimental data and protocols learned in the first module to help them develop their own hypotheses, experimental protocols, and to analyze their own data. Before each lab, students are required to answer questions designed to probe their understanding of required pre-laboratory reading materials. Questions also guide the students through the development of hypotheses and predictions. Following each laboratory, students then answer a series of post-laboratory questions to guide them through the presentation and analysis of their data, and how to place their data into the context of primary literature. Students are also asked to review their initial hypotheses and predictions to determine if their conclusions are supportive. A formal laboratory report is also to be completed after each module, in a format similar to that of primary scientific literature. The Fundamentals of Scientific Research: An Introductory Laboratory Manual is an invaluable resource to undergraduates majoring in the life sciences.
