Chapter 3 FUELS AND COMBUSTION

Self Exercise 3 Gaseous propane of 88 kg/hr is burned in a boiler with 10% excess air to produce 1200 kg/hr of steam at 0.1 MPa and 150°C. The percent conversion of the propane is 100%; of the fuel burned, 90% reacts to form CO₂ and the balance to form CO. The temperature of combustion air, fuel and water entering the boiler is assumed at 25°C.

Engine Performance: Chapter 2- intake and exhaust systems ...

Exhaust gas or flue gas is emitted as a result of the combustion of fuels such as natural gas, gasoline (petrol), diesel fuel, fuel oil, biodiesel blends, or coal. According to the type of engine, it is discharged into the atmosphere through an exhaust pipe, flue gas

stack, or propelling nozzle. It often disperses downwind in a pattern called an exhaust plume.
