The clustering problem has been addressed in many contexts and by researchers in many disciplines; this reflects its broad appeal and usefulness as one of the steps in exploratory data analysis. However, clustering is a difficult problem combinatorially, and differences in assumptions and contexts in different communities has made the transfer of useful generic concepts and methodologies slow to occur.

Data Clustering: A Review

We comprehensively review recent data

stream clustering algorithms and analyze them in terms of the base clustering technique, computational complexity and clustering accuracy. A comparison of these algorithms is given along with still open problems. We indicate popular data stream repositories and datasets, stream processing tools and platforms.

Data stream clustering: a review | SpringerLink

The clustering problem has been addressed in many contexts and by researchers in many disciplines; this reflects its broad appeal and usefulness as one of the steps in exploratory data analysis. However, clustering is a difficult problem combinatorially, and differences in assumptions and contexts in different communities has made the transfer of useful generic concepts and methodologies slow to occur.

CiteSeerX — Data Clustering: A Review

Clustering is an essential data mining tool that plays an important role for analyzing big data. However, large?scale data clustering has become a challenging task because of the large amount of information that emerges from technological progress in many areas, including finance and business informatics.

Iterative big data clustering algorithms: a review ...

Due to use of various social sites, travel, e-governance etc., practices, mammoth amount of data is being heaped every moment. Clustering of information (data) can help in aggregating similar information collected in unformatted databases (mainly text). Hadoop is one such big data processing tool , , . It is

expected that big data processing will play an important role in detection of cyber crime, clustering groups of people with similar behaviour on social network such as face book ...

The output clustering (or clusterings) can be hard (a partition of the data into groups) or fuzzy (where each pattern has a variable degree of membership in each of the output clusters). Hierarchical clustering algorithms produce a nested series of

partitions based on a criterion for merging or splitting clusters based on similarity.

A Review on Data Clustering Algorithms for Mixed Data
Task of grouping a set of objects so that objects in the same group (or cluster) are more similar to each other than to those in other clusters. The result of a cluster analysis shown as the coloring of the squares into three clusters. Cluster analysis or clustering is the task of grouping a set of objects in such a way that objects in the same group (called a cluster) are more similar (in some sense) to each other than to those in other groups (clusters).

Cluster analysis - Wikipedia
Clustering is a significant task in data
analysis and data mining applications. It is
the assignment of combination a set of
objects so that objects in the identical
group are more related to each other than
to those in other groups (clusters). Cluster
is an ordered list of data which have the
familiar characteristics.
