Problem Set 1 5 6. (15 points) Single-slit Diffraction and Uncertainty. Visible light with a wavelength  $\lambda$  is incident from a distant source onto a single slit of width  $a$ ; denote the propagation direction as  $z$ , and the direction transverse to it with  $x$ . Assume  $a$  is a few times larger than  $\lambda$ .

In general, physics seems to have this aura to it that scares people before they even start solving a problem. This begins with very basic physics, but continues with higher level material. The difference seems to be that only those who like physics – and find a good way of dealing with it – stick around to deal with the higher level stuff.
