In object-oriented programming (OOP), encapsulation refers to the bundling of data with the methods that operate on that data, or the restricting of direct access to some of an object's components. Encapsulation is used to hide the values or state of a structured data object inside a class, preventing unauthorized parties' direct access to them.. Publicly accessible methods are generally ...

An object database is a database management system in which information is represented in the form of objects as used in object-oriented programming.Object databases are different from relational databases which are table-oriented. Object-relational databases are a hybrid of both approaches.. Object databases have been considered since the early 1980s.

C++ OOPs Concepts. The major purpose of C++ programming is to introduce the concept of object orientation to the C programming language. Object Oriented Programming is a paradigm that provides many concepts such as inheritance, data binding, polymorphism etc.. The programming paradigm where everything is represented as an object is known as truly object-oriented programming language.
