### **Chapter 13- RNA and Protein Synthesis - Bement CUSD**

RNA and Protein Synthesis (Chapter 13) Messenger RNA, transfer RNA, and ribosomal RNA work together in prokaryotic and eukaryotic cells to translate DNA's genetic code into functional proteins. These proteins, in turn, direct the expression of genes.

### **RNA and Protein Synthesis (Chapter 13) - wedgwood science**

DNA is housed within the nucleus, and protein synthesis takes place in the cytoplasm, thus there must be some sort of

intermediate messenger that leaves the nucleus and manages protein synthesis. This intermediate messenger is messenger RNA (mRNA) , a single-stranded nucleic acid that carries a copy of the genetic code for a single gene out of the nucleus and into the cytoplasm where it is used to produce proteins.

### **3.4 Protein Synthesis – Anatomy and Physiology**

tions, but most RNA molecules are involved in just one job—protein synthesis. RNA controls the assembly of amino acids into proteins. Like workers in a factory, each type of RNA molecule specializes in a different aspect of this job. Figure 13–2 shows the three main types of RNA: messenger RNA, ribosomal RNA, and transfer RNA.!
